

QuickBooks TimeWarp — UI Modernization Deploy Instructions

Safety Backup Created

A backup branch has been created as a recovery point **before** the UI modernization commit is pushed to `origin/main`.

Item	Value
Backup Branch	<code>backup-pre-ui-modernization</code>
Points To	<code>c7cde4b</code> — Merge branch 'joseph-fixes'
What It Preserves	Exact state of <code>origin/main</code> before UI borderless chrome changes
UI Commit	<code>1bad464</code> — UI: Borderless window chrome with Intel Pro Graphics aesthetic

Files Changed in UI Modernization (11 files, +425 / –19 lines)

File	Change
UI/Styles.xaml	+178 lines — Window control buttons, thin scrollbar styles
UI/Views/MainWindow.xaml	+58 lines — Borderless window, custom title bar
UI/Views/MainWindow.xaml.cs	+60 lines — Drag, minimize, maximize, close handlers
UI/Views/AboutWindow.xaml	+28 lines — Borderless chrome, title bar
UI/Views/AboutWindow.xaml.cs	+7 lines — Title bar drag
UI/Views/SettingsWindow.xaml	+30 lines — Borderless chrome, title bar
UI/Views/SettingsWindow.xaml.cs	+6 lines — Title bar drag
UI/Views/CompletionWindow.xaml	+29 lines — Borderless chrome, title bar
UI/Views/CompletionWindow.xaml.cs	+6 lines — Title bar drag
UI/Views/EulaWindow.xaml	+36 lines — Borderless chrome, title bar
UI/Views/EulaWindow.xaml.cs	+6 lines — Title bar drag

Step 1: Push the Backup Branch (Safety Net)

```
cd C:\path\to\QuickBooks-TimeWarp
git push origin backup-pre-ui-modernization
```

This pushes the backup to GitHub so you have a remote recovery point.

Step 2: Push Main with UI Changes

```
git push origin main
```

This pushes the single UI modernization commit (1bad464) to origin/main .

Step 3: Verify on GitHub

After pushing, verify on GitHub that:

- main shows commit 1bad464 at the top
- backup-pre-ui-modernization branch exists and points to c7cde4b

Emergency Rollback (If Needed)

Option A: Reset main to backup (nuclear rollback)

```
# Reset local main to the backup point
git checkout main
git reset --hard backup-pre-ui-modernization

# Force push to remote (⚠ destructive – removes UI commit from remote)
git push origin main --force
```

Option B: Revert the UI commit (preserves history)

```
# Create a revert commit that undoes the UI changes
git checkout main
git revert lbad464

# Push the revert (safe – no force push needed)
git push origin main
```

Option C: Re-apply UI changes after rollback

```
# If you rolled back but want the UI changes again later:
git cherry-pick lbad464
git push origin main
```

Cleanup (After Confirming Everything Works)

Once you've verified the UI changes work correctly in the built application:

```
# Delete the backup branch locally
git branch -d backup-pre-ui-modernization

# Delete the backup branch on GitHub
git push origin --delete backup-pre-ui-modernization
```
