

QB-TimeWarp — Testing Checklist

Purpose: Step-by-step testing guide for validating the migration pipeline. Follow each stage in order.

Pre-Test: Critical Setup

- [] **Ensure QuickBooks windows remain VISIBLE throughout testing** — do NOT minimize them
 - [] **Enter passwords when prompted** by QuickBooks:
 - Air-Masters-QB-2023.qbw → 3825You171
 - Josh Safty 2021.qbw → 3825You171
 - Blank Template → FL0640098!@!
 - [] **User is actively watching** — coordinate before each major stage
 - [] Review `POPOP_HANDLING.md` for common popups you may encounter
-

Stage 0: Working Copy Verification (SAFETY CHECK)

0.1 Verify Original Files Exist on Desktop

- [] Confirm `C:\Users\AIAgent\Desktop\Joshua's Gold Coast\` exists with a `.qbw` file
- [] Confirm `C:\Users\AIAgent\Desktop\Blank Template\` exists with a `.qbw` file
- [] Note the file sizes of both originals

0.2 Working Copy Creation

- [] Run QB-TimeWarp — observe “Initialize Working Copies (SAFETY FIRST)” step
- [] Verify `C:\QB-TimeWarp\Working\Source\` is created with a copy of the source `.qbw`
- [] Verify `C:\QB-TimeWarp\Working\Target\` is created with a copy of the target `.qbw`
- [] Verify file sizes in Working directories match original Desktop file sizes
- [] Confirm console shows “WORKING WITH COPIES — ORIGINALS PRESERVED”
- [] Confirm console shows “✓ Using working copy (originals protected)” for each QB connection

0.3 Safety Validation

- [] Verify original Desktop files are **unchanged** (same size, same modified date)
- [] Confirm no operations are logged against Desktop paths
- [] Test `--refresh` flag: re-run with `--refresh` and verify files are re-copied
- [] Test `--cleanup` flag: run with `--cleanup` and verify Working directories are removed

0.4 Protection Test (Optional)

- [] Temporarily change `appsettings.json` `CompanyFilePath` to a Desktop path
 - [] Run QB-TimeWarp — should exit with code 99 (SAFETY VIOLATION)
 - [] Restore correct configuration
-

Prerequisites

- [] Windows VM is accessible via RDP (`aiagent.hostedremotedesktop.com:4420`)
 - [] QuickBooks 2023 is installed and running
 - [] QuickBooks 2021 is installed and running
 - [] **Working copies created** in `C:\QB-TimeWarp\Working\` (automatic on first run)
 - [] **Both QuickBooks windows are VISIBLE on screen** (not minimized)
 - [] Application is built and deployed to `C:\QB-TimeWarp`
 - [] `appsettings.json` has correct paths (verify SourceFiles and TargetFiles Desktop folders)
-

Stage 1: Export Testing

1.1 Basic Export

- [] Run QB-TimeWarp — observe Step 1 (Export) in console
- [] Verify `.\ExportedData\` directory is created
- [] Verify JSON files are created for each entity type listed in `appsettings.json`
- [] **Expected:** One JSON file per entity type (e.g., `Accounts.json` , `Customers.json` , etc.)

1.2 Inactive Entity Export

- [] Check console output for “Including inactive records” message
- [] Open any exported JSON file (e.g., `Customers.json`)
- [] Verify entities with `"IsActive": "false"` are present
- [] Check export manifest for `TotalActiveRecords` and `TotalInactiveRecords` counts
- [] **Expected:** Both active and inactive records are exported; inactive count > 0

1.3 Export Completeness

- [] Verify all 26 entity types in config have corresponding export files
- [] Verify entity counts are reasonable (cross-check with QB 2023 UI if possible)
- [] Check for any error messages in `.\Logs\` directory
- [] **Expected:** No errors; all entity types exported successfully

CHECKPOINT: STOP and check with user

Before proceeding to Stage 2: Share export summary with user. Confirm entity counts look reasonable. Ask if any popups appeared that need attention.

Stage 2: Transformation Testing

2.1 Inactive → Active Reactivation

- [] Check console output for transformation report
- [] Verify “Reactivated Entities” count is displayed and > 0
- [] Spot-check transformed data: all entities should have `"IsActive": "true"`
- [] **Expected:** All previously inactive entities are now active

2.2 Class Tracking

- [] Check console output for “Discovered X unique classes”
- [] Verify the class list is complete (compare with QB 2023 class list)
- [] **Expected:** All classes used in transactions are discovered

2.3 Format Preservation

- [] Check transformation report for format preservation statistics
- [] Verify date fields are in `yyyy-MM-dd` or `yyyy-MM-ddTHH:mm:ss` format
- [] Verify currency fields have 2 decimal places
- [] Verify phone numbers are ≤ 21 characters
- [] Verify postal codes are ≤ 13 characters with leading zeros preserved
- [] **Expected:** All format stats show “preserved” counts matching “processed” counts

2.4 Field Mapping

- [] Check for any truncation warnings in the log
- [] Verify no data was silently dropped
- [] **Expected:** Truncations are logged; no data loss without logging

CHECKPOINT: STOP and check with user

Before proceeding to Stage 3 (Import): This is the most critical step — data will be written to QB 2021. Share transformation report with user. Confirm all transformations look correct. Get explicit go-ahead before importing.

Stage 3: Import Testing

3.1 Accounting Model Match

- [] Check console for “Accounting Method: [Cash/Accrual]” from source
- [] Verify target QB 2021 accounting method matches source
- [] **Expected:** Both should show same method (Cash or Accrual)

3.2 Class Creation

- [] Check console for “Created X classes in QB 2021”
- [] Open QB 2021 → Lists → Class List
- [] Verify all source classes exist (including hierarchical parent:child)
- [] **Expected:** All required classes present in QB 2021

3.3 Entity Import

- [] Watch console for import progress per entity type
- [] Check for any “Error” or “Failed” messages
- [] Verify import order follows dependency sequence (Accounts first, Transactions last)
- [] **Expected:** All entities import without errors

3.4 Import Error Handling

- [] If `SkipOnError: true`, check for skipped records in the log
- [] Review any skipped records — are they expected failures?

- [] **Expected:** Minimal skipped records; any skips are logged with reason

CHECKPOINT: STOP and check with user

After import completes: Share import results with user. Ask them to spot-check QB 2021 for imported data. Confirm everything looks good before running validation.

Stage 4: Validation Testing

4.1 Entity Count Verification

- [] Check validation report for entity count comparison
- [] Source count should equal target count for each entity type
- [] **Expected:** All entity counts match (or differences are explained)

4.2 Field-by-Field Comparison

- [] Check validation report for field comparison results
- [] Investigate any mismatches
- [] **Expected:** All fields match (within tolerance for amounts)

4.3 Financial Reconciliation

- [] Check total amounts for invoices, bills, payments
- [] Source totals should match target totals (within \$0.01 tolerance)
- [] **Expected:** Financial totals reconcile

4.4 Journal Balance Validation **CRITICAL**

- [] Check validation report for journal entry balance results
- [] **Every** journal entry must have total debits = total credits
- [] Any imbalanced journals are CRITICAL issues — investigate immediately
- [] **Expected:** ALL journals balanced; 0 imbalanced entries

4.5 Format Preservation Validation

- [] Check format validation section of the report
 - [] All date fields should pass QB 2021 format check
 - [] All currency fields should have proper decimal precision
 - [] All phone fields should be within length limits
 - [] All postal code fields should be within length limits
 - [] **Expected:** 0 format validation issues
-

Post-Migration Verification (Manual in QuickBooks)

5.1 QuickBooks 2021 Spot Checks

- [] Open QB 2021 → Chart of Accounts — verify accounts match QB 2023
- [] Open Customer Center — verify customer list (including formerly inactive)
- [] Open Vendor Center — verify vendor list
- [] Check a sample invoice — verify amounts, dates, line items

- [] Check a sample bill — verify amounts, dates, line items
- [] Run P&L report — compare with QB 2023 P&L
- [] Run Balance Sheet — compare with QB 2023 Balance Sheet
- [] Run P&L by Class — verify class assignments are preserved

5.2 Financial Report Comparison

- [] P&L (current year): QB 2023 total = QB 2021 total
- [] Balance Sheet (current date): QB 2023 total = QB 2021 total
- [] A/R Aging: QB 2023 totals = QB 2021 totals
- [] A/P Aging: QB 2023 totals = QB 2021 totals

How to Interpret Logs and Reports

Log Files (`.\Logs\QB-TimeWarp-{Date}.log`)

- **[INF]**: Informational — normal operation
- **[WRN]**: Warning — non-critical issue (e.g., truncation, missing optional field)
- **[ERR]**: Error — something failed (investigate immediately)
- **[FTL]**: Fatal — application crashed (check stack trace)

Validation Report (`.\Validation\report.json`)

```
{
  "OverallResult": "Pass",           // or "Fail"
  "EntityCountVerification": {},      // count comparisons
  "FieldComparison": {},             // field-level diffs
  "FinancialReconciliation": {},      // amount comparisons
  "JournalValidation": {},           // debit/credit balance
  "FormatValidation": {}             // format compliance
}
```

- **OverallResult = "Pass"**: Migration is successful
- **OverallResult = "Fail"**: Check individual sections for failures
- **JournalValidation failures**: CRITICAL — do not proceed until resolved
- **FormatValidation failures**: Review severity — "Warning" may be acceptable, "Error" must be fixed

Export Manifest

- Located in `.\ExportedData\manifest.json`
 - Contains entity counts, active/inactive breakdowns, export timestamp
 - Use to verify export completeness before proceeding to transform
-

Troubleshooting Common Issues

Symptom	Likely Cause	Fix
“COM object” error	QB not running or wrong architecture	Ensure QB is running; verify x86 build
“Company file not found”	Wrong path in config	Check <code>appsettings.json</code> <code>CompanyFilePath</code>
“Access denied” to company file	Multi-user mode or permissions	Switch to single-user mode in QB
Entities skipped during import	Dependency not yet imported	Verify import order in config
Journal imbalance	Rounding during transform	Check currency precision settings
Date format error	Timezone not stripped	Verify <code>stripTimezoneFromDates: true</code> in <code>FieldMappings.json</code>

Troubleshooting: QuickBooks Popups During Testing

QuickBooks frequently generates popups that can block SDK operations. Keep windows visible and watch for these.

Popup	What to Do
“An application wants to access QuickBooks” (SDK permission)	Click “Yes, always allow access” — this authorizes the QBXML SDK connection
Company file password prompt	Enter the correct password (see Pre-Test section above)
“Another user is logged in” / Multi-user warning	Switch to single-user mode : File → Switch to Single-user Mode
“QuickBooks needs to update”	Click “Skip” or “Remind me later” — do NOT update during testing
“Registration” or “License” dialog	Dismiss or close — do NOT proceed with registration during testing
“Do you want to back up?” on close	Click “No” unless you specifically want a backup
Unrecognized popup	STOP — screenshot it and check with user before clicking anything

See `POPUP_HANDLING.md` for a comprehensive popup reference guide.
